

Read Me file:

TableTools 1.01 includes bug fixes that were found in Release 1.0.

In addition, the following are known omissions from the User's Guide.

I. Omission from the Trademarks/Owner information on the back of the title page:

TableTools™ was developed using Lightspeed C™. Lightspeed C is a trademark of Think Technologies, Inc.

Portions © Copyright 1986 ALSoft, Inc. - All rights reserved.

II. Radius monitors:

In addition to disabling the tearoff menus and small screen, you may also need to disable the Expanded Menu Bar option. The Expanded Menu Bar option uses a Chicago 16 font for commands in menus instead of the Chicago 12 System font. This option causes boxes to appear in TableTools menus. For more information about Radius monitors, read Page xii in the Preface.

III. New Feature:

You may use the From Within Shuttle to Excel to create a graphic (in this case, an Excel chart) in a cell. You create an Excel chart for a cell just as you do any other graphic. You select a cell, and shuttle the contents of just that cell to Excel.

To Shuttle From TableTools To Excel Under Both The Finder And MultiFinder:

1. Select a cell.
2. Click From Within in the mode palette.
3. Choose the Graphics command from the Shuttle menu.
4. Continue to drag down the submenu until Excel is highlighted, then release the mouse button.

To Shuttle An Excel Chart From Excel Back To TableTools Under Both The Finder And MultiFinder:

1. Click the chart window.
2. Choose the Save As... command from the File menu.

An Excel chart in a cell has two files associated with it, a data file containing the

spreadsheet data (called aaExcelData), and a chart file (called aaExcelGraphic). TableTools saves the data contained in both these files as part of your TableTools file.

3. In the text box labeled Save chart as, type the name aaExcelGraphic.

4. Click Save.

An alert box appears asking if you want to replace the existing aaExcelGraphic.

5. Click Yes.

6. Choose the Copy Chart command from the Excel Edit menu.

An alert box appears.

7. Choose either As shown on screen or As shown when printed.

8. Click OK.

9. Click the spreadsheet window to save the spreadsheet file.

10. Choose the Save command.

11. Choose Quit from the File menu(Finder), or click the TableTool window(MultiFinder).

IV. Printing Errors in the User's Guide:

Page 1.1-2: The first paragraph mistakenly states that there is a fourth tutorial in which you work at the Advanced Power level.

Page 1.1-10: In step 2, the words "from the" are repeated twice.

Page 1.1-15: Closing quotation marks are missing from the last bulleted item in the list.

Page 2.3-10, and Appendix B-7. Command and the up arrow: Go to the start of the previous sentence.
