## RECREATE MANKIND

The population of the earth has been destroyed by a deadly plague. You, a biologist sent into space to run genetic engineering experiments, are the only surviving human being in the whole universe. In your space capsule, you have a massive store of genetic material, and the computing and bio-technical power to bring it to life. But watch out! Mutations can occur. Create a hideous lifeform or a miraculous human being. The fate of mankind is in your hands!

### Incubation Control Panel

Control levels of oxygen, nutrients and fluids to grow a healthy human embryo. Zoom in to the heart of a cell for a look at the very building blocks of life. Use the electron microscope to identify and treat evil microbes. Inject the right antibiotic - or the embryo dies!

### Genetic Sequencing Computer

Command the process in your sequencing computer in order to re-create the human race. Manipulate DNA, genes and chromosomes to eliminate bizarre deviations. Build your own gene sequences in the DNA library and prevent future mutations.

### Artificial Womb

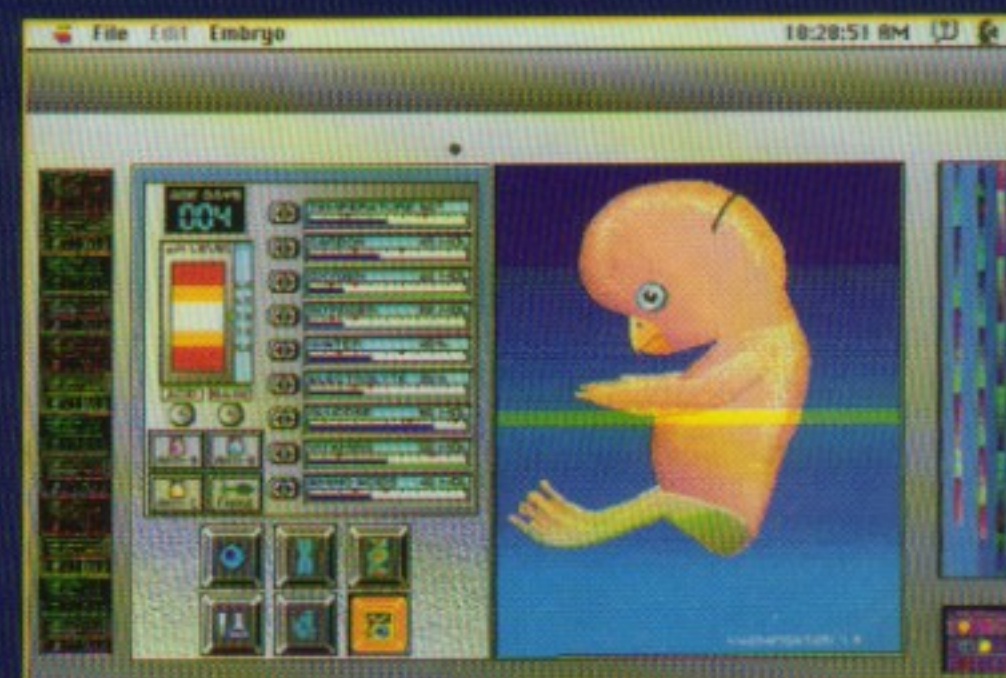

Conceive life and watch cells divide and grow in vivid animation. In this chamber, you control the outcome of the race. Will you recreate a healthy human being or an unthinkable monstrosity? The choice is yours!

### Space Lab

Confront this truth...only you can save the human race! Sitting at the control panel in your space lab, you have all the tools to reconstruct mankind. Never before and perhaps never again will this opportunity fall into the hands of one mortal being. For all of our sakes, we wish you **Good Luck!!**

#### G-NETIX FEATURES

- Stunning Animated graphics
- Primer on genetics
- Easy, educational and exciting to play
- Digitized sound
- Guide the development of cells to re-create human beings
