Subject: ch.eduBEdit 2.1.3 (Repost)

This is the third revision of BEdit, a free text editor. This revision fixes a few bugs and incompatibilities that surfaced in BEdit 2.1, the first public release, and in 2.1.1, the first revision. The version enclosed is version 2.1.3, which completely supersedes any previous version.

BEdit is 32-bit clean, compatible with any Macintosh running system version 6.0 or later, and when running under System 7.0, takes specific advantage of new features to enhance performance and appearance.

BEdit is also very economical with respect to disk and memory usage; it will run in a partition as small as 256K. The size of any file is only limited by the amount of memory available in BEdit's partition; there is no 32K upper bound.

BEdit offers fast and flexible multi-file search and replace capabilities; under System 7, it can also use On Location 2.0 as a searching engine. Grep pattern-matching is available for single- or multi-file searches.

BEdit may be freely distributed, subject to the conditions specified in the "Read Me" file, which is part of the distribution archive.
